

FIGURE 3.15 ER diagrams for the COMPANY schema, with structural constraints specified using (min, max) notation.

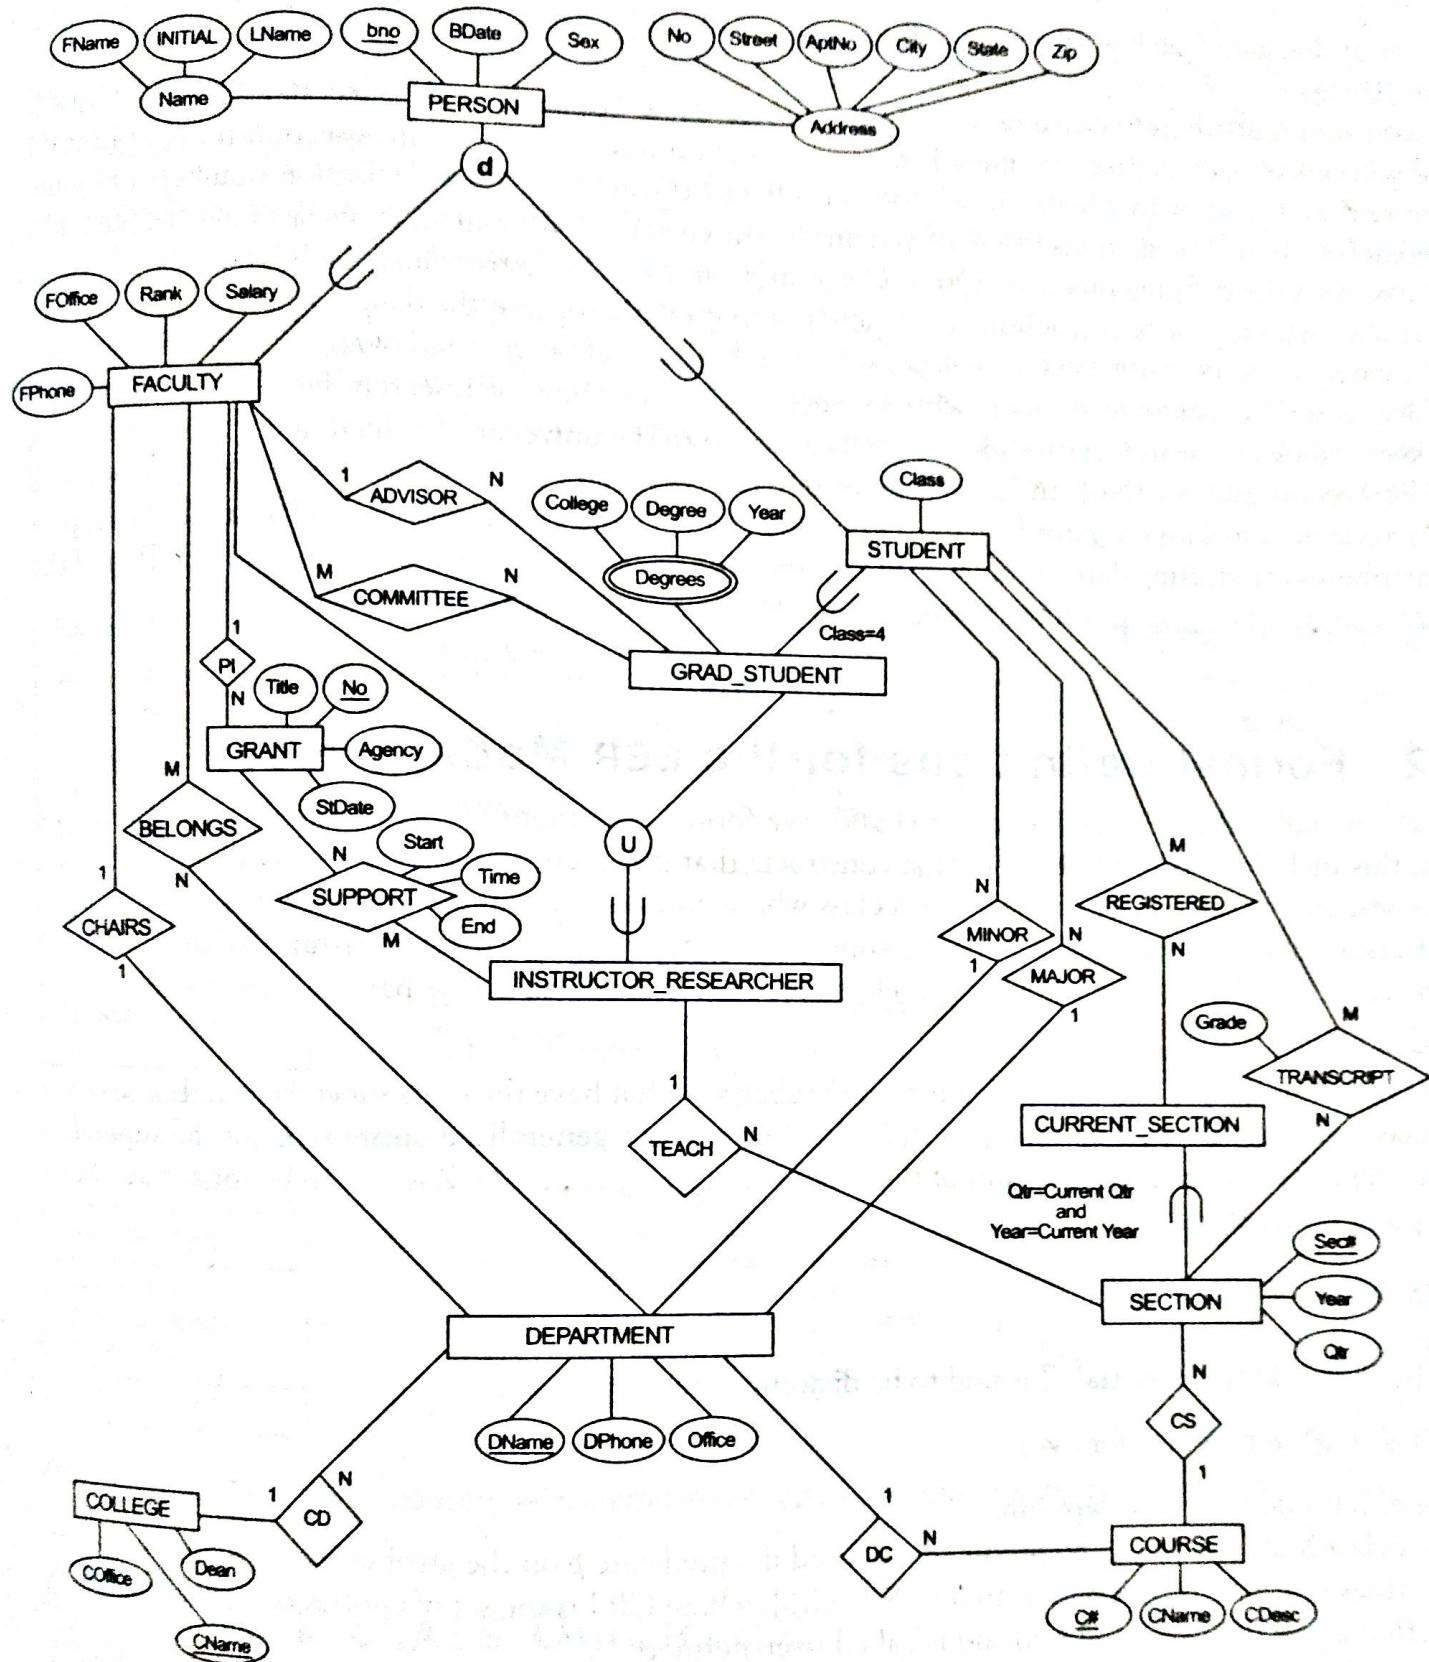

FIGURE 3.24 An EER conceptual schema for a UNIVERSITY database.

GRAD_STUDENT is a subtype of **STUDENT**. For each graduate student, Class = 4. For each graduate student,

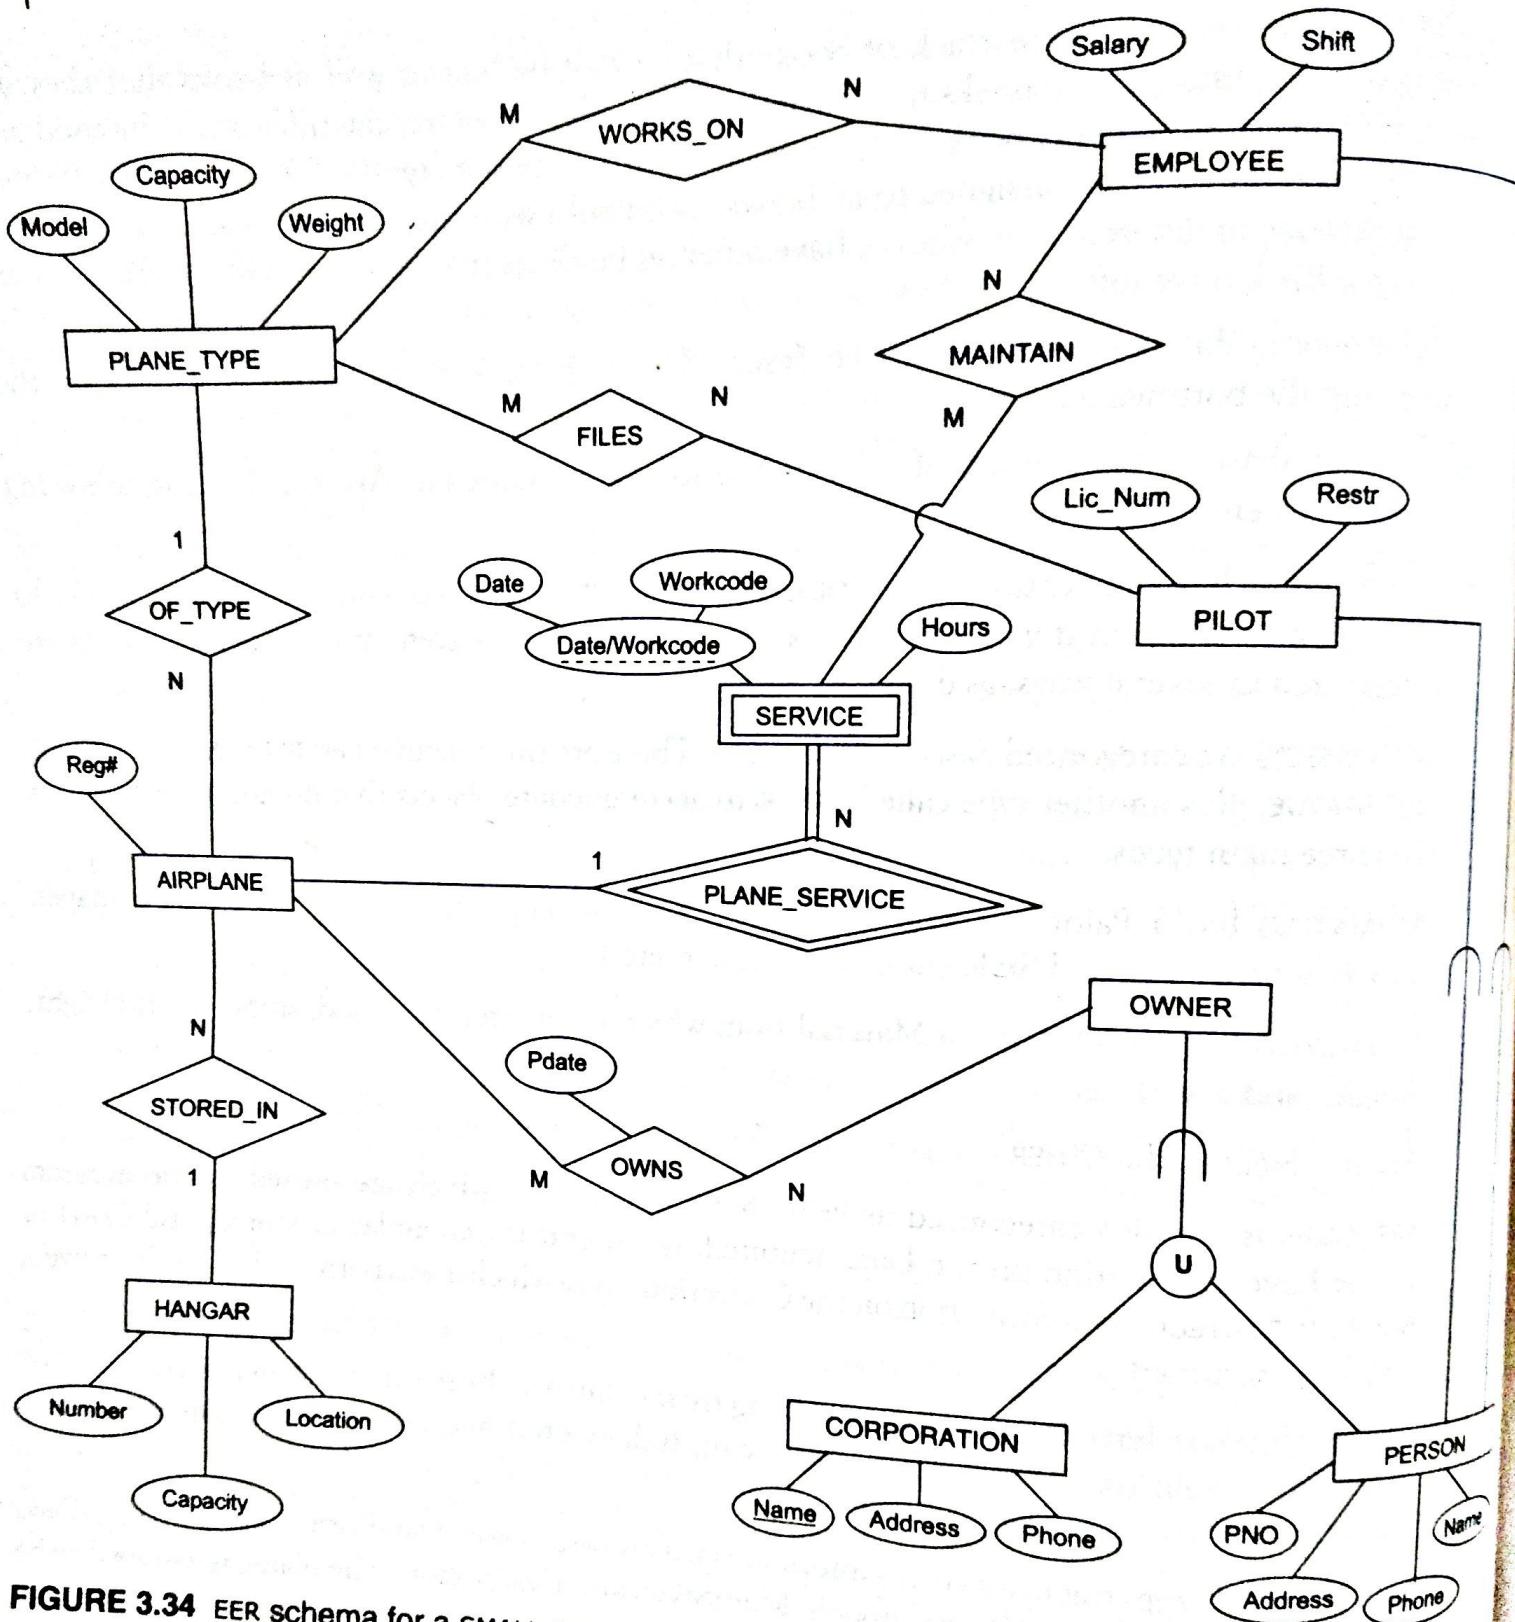

FIGURE 3.34 EER schema for a SMALL AIRPORT database.

TYPE has a model number [Model], a capacity [Capacity], and a weight [Weight]. Each HANGAR has a number [Number], a capacity [Capacity], and a location [Location]. The database also keeps track of the OWNERS of each plane [OWNS] and the EMPLOYEES who have maintained the plane [MAINTAIN]. Each relationship instance in OWNS relates an airplane to an owner and includes the purchase date [Pdate]. Each relationship instance in MAINTAIN relates an employee to a service record [SERVICE]. Each plane undergoes service many times; hence, it is a many-to-many relationship. A service record is also a many-to-many relationship. Each corporation has a name, address, and phone number. Each person has a name, address, and phone number.

catalog, and user activity.

members, the books, the

- 3.43. Design a database to keep track of information for an art museum. Assume that the following requirements were collected:

- The museum has a collection of **ART_OBJECTs**. Each **ART_OBJECT** has a unique IdNo, an Artist (if known), a Year (when it was created, if known), a Title, and a Description. The art objects are categorized in several ways, as discussed below.
- **ART_OBJECTs** are categorized based on their type. There are three main types: **PAINTING**, **SCULPTURE**, and **STATUE**, plus another type called **OTHER** to accommodate objects that do not fall into one of the three main types.
- A **PAINTING** has a PaintType (oil, watercolor, etc.), material on which it is DrawnOn (paper, canvas, wood, etc.), and Style (modern, abstract, etc.).
- A **SCULPTURE** or a **STATUE** has a Material from which it was created (wood, stone, etc.), Height, Weight, and Style.
- An art object in the **OTHER** category has a Type (print, photo, etc.) and Style.
- **ART_OBJECTs** are also categorized as **PERMANENT_COLLECTION**, which are owned by the museum (these have information on the DateAcquired, whether it is OnDisplay or stored, and Cost) or **BORROWED**, which has information on the Collection (from which it was borrowed), DateBorrowed, and DateReturned.
- **ART_OBJECTs** also have information describing their country/culture using information on country/culture of Origin (Italian, Egyptian, American, Indian, etc.) and Epoch (Renaissance, Modern, Ancient, etc.).
- The museum keeps track of **ARTIST**'s information, if known: Name, DateBorn (if known), DateDied (if not living), CountryOfOrigin, Epoch, MainStyle, and Description. The Name is assumed to be unique.
- Different **EXHIBITIONS** occur, each having a Name, StartDate, and EndDate. **EXHIBITIONS** are related to all the art objects that were on display during the exhibition.
- Information is kept on other **COLLECTIONS** with which the museum interacts, including Name (unique), Type (museum, personal, etc.), Description, Address, Phone, and current ContactPerson.

- 3.44. Draw an EER schema diagram for this application. Discuss any assumptions you made, and that justify your EER design choices.
- Figure 3.34 shows an example of how to draw an EER schema diagram. It includes entities like ARTIST, EXHIBITION, and COLLECTION, along with their attributes and relationships.

prerequisites of each course.

STUDENT	Name	StudentNumber	Class	Major
	Uday	17	1	CS
	Nitin	8	2	CS

FIGURE 1.2 A database that stores student and course information.

2. We use the term file informally here. At a conceptual level, a file is a collection of records that may or may not

- 7.22. Specify the following queries in SQL on the database schema of Figure 1.2.
- Retrieve the names of all senior students majoring in 'CS' (computer science).
 - Retrieve the names of all courses taught by Professor Jain in 1998 and 1999.
 - For each section taught by Professor Jain, retrieve the course number, semester, year, and number of students who took the section.
 - Retrieve the name and transcript of each senior student (Class = 5) majoring in CS. A transcript includes course name, course number, credit hours, semester, year, and grade for each course completed by the student.
 - Retrieve the names and major departments of all straight-A students (students who have a grade of A in all their courses).
 - Retrieve the names and major departments of all students who do not have a grade of A in any of their courses.

- 7.23. Write SQL update statements to do the following on the database schema shown in Figure 1.2.
- Insert a new student, <'Johnson', 25, 1, 'MATH'>, in the database.
 - Change the class of student 'Uday' to 2.
 - Insert a new course, <'Knowledge Engineering', 'CS4390', 3, 'CS'>.
 - Delete the record for the student whose name is 'Uday' and whose student number is 17.

FIGURE 4.5 Schema diagram for the COMPANY relational database schema.
underlined attributes represent primary keys for the relations
in the COMPANY schema.

- 1.33. Repeat Exercise 1.21, but write a query to answer the following questions.
- 1.34. Specify the following views in SQL on the COMPANY database schema shown in Figure 4.5.
- a. A view that has the department name, manager name, and manager salary for every department.
 - b. A view that has the employee name, supervisor name, and employee salary for each employee who works in the 'Research' department.
 - c. A view that has the project name, controlling department name, number of employees, and total hours worked per week on the project for each project.
 - d. A view that has the project name, controlling department name, number of employees, and total hours worked per week on the project for each project with more than one employee working on it.
- 1.35. Consider the following view, DEPT_SUMMARY, defined on the COMPANY database of Figure 4.6:
- ```
CREATE VIEW DEPT_SUMMARY AS SELECT DEPARTMENT_ID, COUNT(SALARY) AS TOTAL_S, AVG(SALARY) AS AVERAGE_S
```

| EMPLOYEE | FNAME | INITIAL | LNAME     | EENO       | BDATE                           | ADDRESS | SEX   | SALARY    | SUPERENO | DNO |

FIGURE 4.6 One possible database state for the COMPANY relational database schema.

4.2 A - Primary Key, Foreign Key, and Foreign

- 7.20. Specify the following additional queries on the database of Figure 4.5 in SQL. Show the query results if each query is applied to the database of Figure 4.6.
- For each department whose average employee salary is more than Rs. 30,000, retrieve the department name and the number of employees working for that department.
  - Suppose that we want the number of *male* employees in each department rather than all employees (as in Exercise 7.20a). Can we specify this query in SQL? Why or why not?

hours worked

with more than one employee working on it.

Q5. Consider the following view, DEPT\_SUMMARY, defined on the COMPANY database of Figure 4.6:

**CREATE VIEW DEPT\_SUMMARY (D, C, TOTAL\_S, AVERAGE\_S)**  
**AS SELECT DNO, COUNT (\*), SUM (SALARY), AVG (SALARY)**  
**FROM EMPLOYEE**  
**GROUP BY DNO;**

State which of the following queries and updates would be allowed on the view. If a query or update would be allowed, show what the corresponding query or update on the base relations would look like, and give its result when applied to the database of Figure 4.6.

- a. **SELECT \* FROM DEPT\_SUMMARY;**
- b. **SELECT D, C FROM DEPT\_SUMMARY WHERE TOTAL\_S > 100000;**
- c. **SELECT D, AVERAGE\_S FROM DEPT\_SUMMARY WHERE C > (SELECT C FROM DEPT\_SUMMARY WHERE D=4);**
- d. **UPDATE DEPT\_SUMMARY SET D=3 WHERE D=4;**
- e. **DELETE FROM DEPT\_SUMMARY WHERE C > 4;**
